

Project Planning Phase

This phase outlines the implementation roadmap, resource allocation, risk management strategies, and environment preparation required to execute the **Implement Client Script & UI Policy (Incident)** project.

1. Work Breakdown Structure (WBS)

- 1. Implement Client Script & UI Policy (Incident)
 - └─ 1.1 Environment Setup & Prerequisites
 - └─ 1.1.1 Verify ServiceNow instance access (Admin/Config rights)
 - └─ 1.1.2 Baseline existing Incident form configurations
 - └─ 1.2 Declarative Logic Development
 - └─ 1.2.1 Create UI Policy: "High Impact Control" (Impact = 1)
 - └─ 1.2.2 Create UI Policy Action: Urgency -> Read-only = true
 - └─ 1.3 Client-Side Script Development
 - └─ 1.3.1 Create onChange Script: Auto set urgency on high impact
 - └─ 1.3.2 Create onSubmit Script: Prevent save if Assigned To missing
 - └─ 1.3.3 Create onCellEdit Script: Prevent state change via list edit
 - └─ 1.4 Quality Assurance & Testing
 - └─ 1.4.1 Test UI Policy & onChange setting (Impact = 1)
 - └─ 1.4.2 Test onSubmit validation (Missing Assigned To)
 - └─ 1.4.3 Test reverse conditions (Impact changed from 1 to Medium/Low)
 - └─ 1.4.4 Test list-edit restriction on State field
 - └─ 1.5 Deployment & Documentation
 - └─ 1.5.1 Review client-side performance impact
 - └─ 1.5.2 Document implementation details & sign-off

2. Implementation Milestones & Timeline

Phase / Task ID	Task Name	Description	Deliverable
M1	Environment Readiness	Verify developer/admin permissions on the ServiceNow instance.	Configured sandbox/dev environment
M2	UI Policy Implementation	Configure High Impact Control UI Policy and Urgency action.	Functional UI Policy record
M3	Client Scripts Deployment	Implement onChange, onSubmit, and onCellEdit scripts.	Active Client Scripts

Phase / Task ID	Task Name	Description	Deliverable
M4	Verification & Testing	Execute all 5 testing activities across Incident form and list views.	Testing sign-off / QA pass
M5	Closure & Final Review	Complete project documentation and code review.	Finalized implementation package

3. Risk Assessment & Mitigation Plan

Risk	Impact	Probability	Mitigation Strategy
Infinite Loops or Script Conflicts	High	Low	Always include guard statements like if (isLoading newValue == "") return; in onChange scripts.
List Editing Bypassing Form Rules	Medium	Medium	Implement an onCellEdit script specifically for critical fields like State.
User Confusion on Reverted Values	Low	Medium	Enable Reverse if false on UI Policies and provide standard g_form.addInfoMessage notifications.
Performance Overhead	Medium	Low	Use native UI Policies over scripts where possible for declarative field control.

4. Prerequisites & Dependencies

- **Access Requirements:** System Administrator (admin) or Personal Developer Instance (PDI) configuration rights.
- **Table Access:** Read/Write access to sys_ui_policy, sys_ui_policy_action, and sys_script_client tables.
- **Module Dependencies:** Incident Management (incident table).
